Model-View-Controller and Event Driven UI

CS 160: User Interfaces

Jeffrey Heer

Includes slides based on those of James Landay.

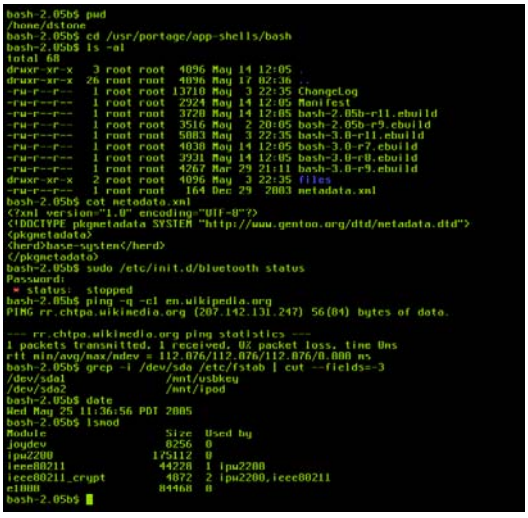
Topics

Interactive application programming
- Component Model
- Event-Driven User Interfaces

Model-View-Controller
- Architecture for interactive components
- Why do we need it?
- Changing the display

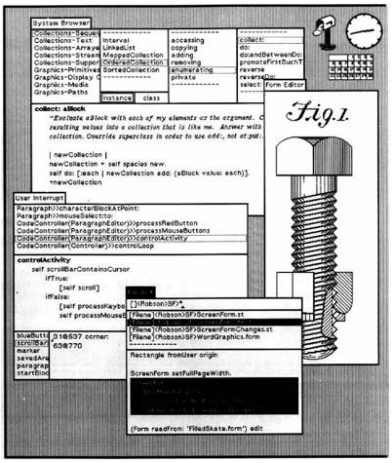
Interactive Application Programming

In the beginning...



http://www.cryptonomicon.com/beginning.html

The Xerox Alto (1973)



Event-Driven UIs

Old model (e.g., UNIX shell, DOS)

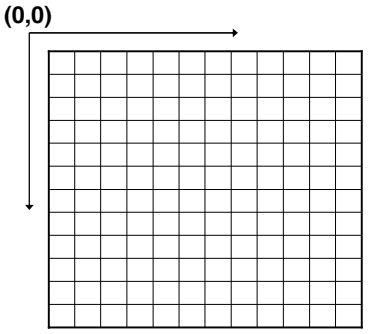
- Interaction controlled by system, user queried for input when needed by system

Event-Driven Interfaces (e.g., GUIs)

- Interaction controlled by user
- System waits for user actions and then reacts
- More complicated programming and architecture

2D Graphics Model

- Drawing Canvas with coordinate system
  - Origin typically at top-left, increasing down and to the right
  - Units depend on the output medium (e.g., pixels for screen)
- Graphics Context
  - Device-independent drawing abstraction
  - Potentially holds state for
    - Clipping region
    - Color
    - Typefaces
    - Stroke model
    - Coordinate transforms
  - Rendering methods
    - Draw, fill shapes
    - Draw text strings
    - Draw images



Component or Widget Model

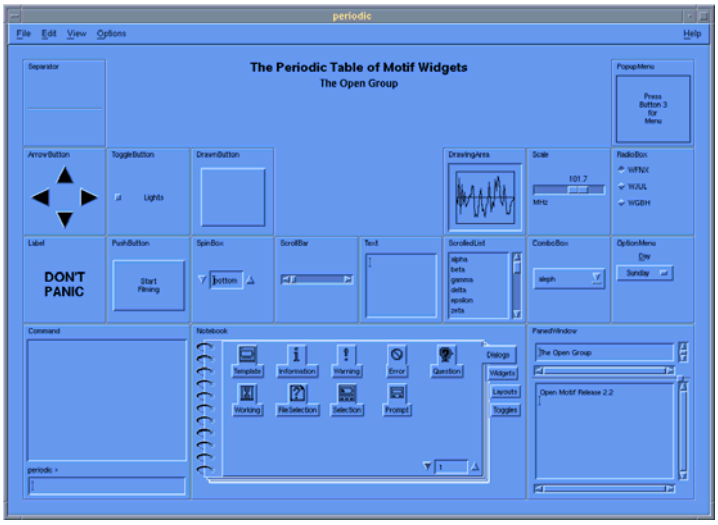
Encapsulation and organization of interactive components ("widgets")
  - Typically using a class hierarchy with a top-level "Component" type implementing basic bounds management, and event processing

Drawn using underlying 2D graphics library

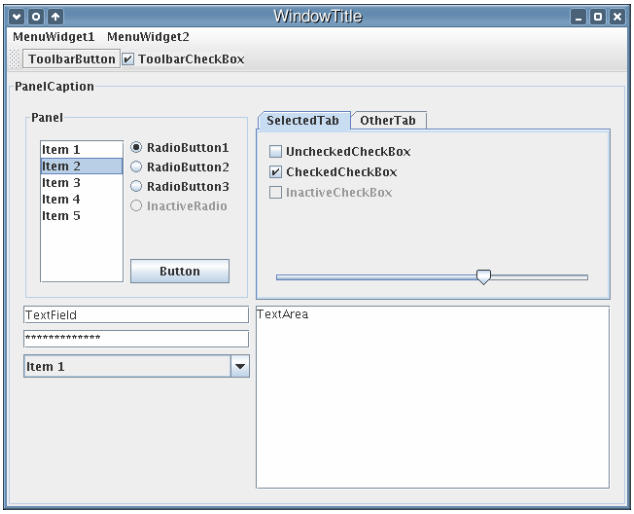
Input event processing and handling
  - Typically mouse and keyboard events

Bounds management (damage/redraw)
  - Only redraw areas in need of updating

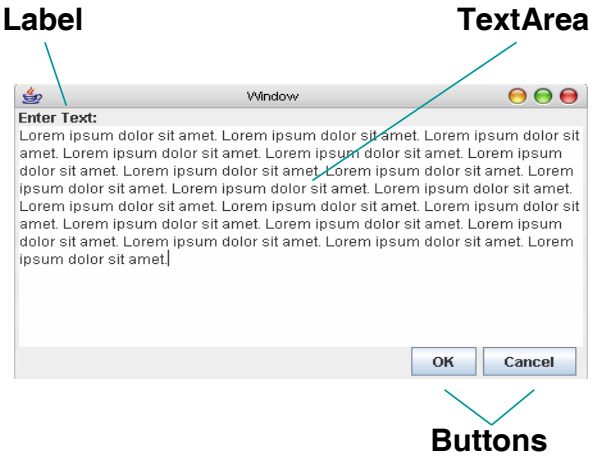
Periodic Table of Motif Widgets



Java Swing Widgets



User Interface Components



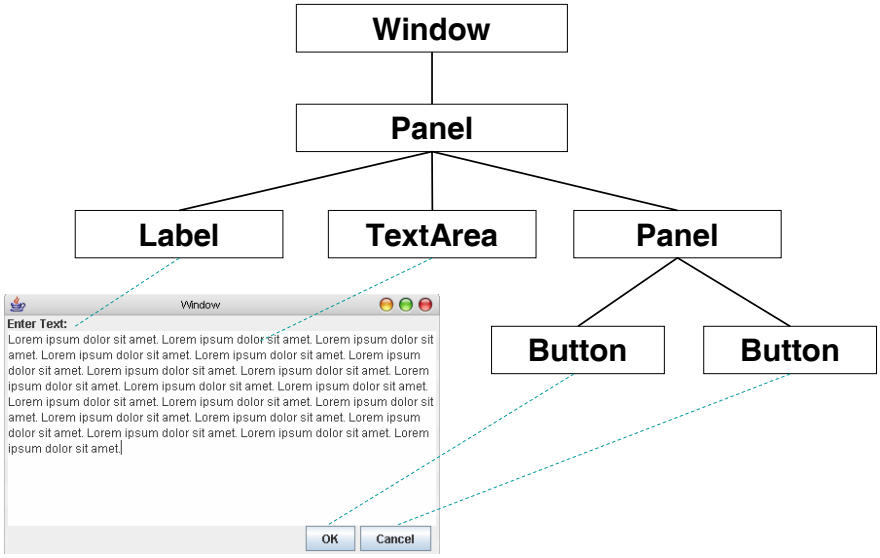
Each component is a clipped 2D canvas with its own coordinate system.

User Interface Components

- Each component is an object with
  - Bounding box
  - Paint method for drawing itself
    - Drawn in the component's co-ordinate system
  - Callbacks to process input events
    - Mouse clicks, typed keys

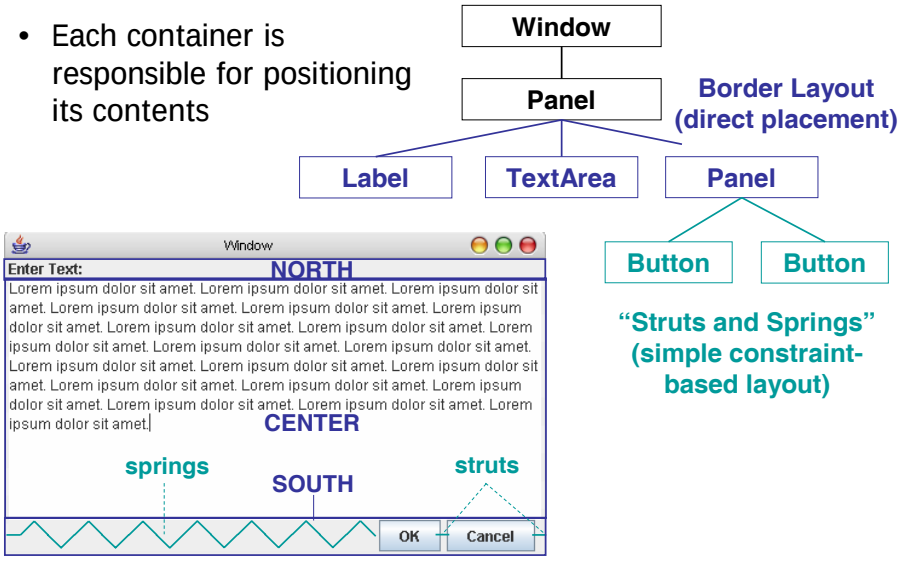
```
public void paint(Graphics g) {
  g.fillRect(...); // interior
  g.drawString(...); // label
  g.drawRect(...); // outline
}
```

Containment Hierarchy



Component Layout

- Each container is responsible for positioning its contents



Events

User input is modeled as “events” that must be handled by the system.

Examples?

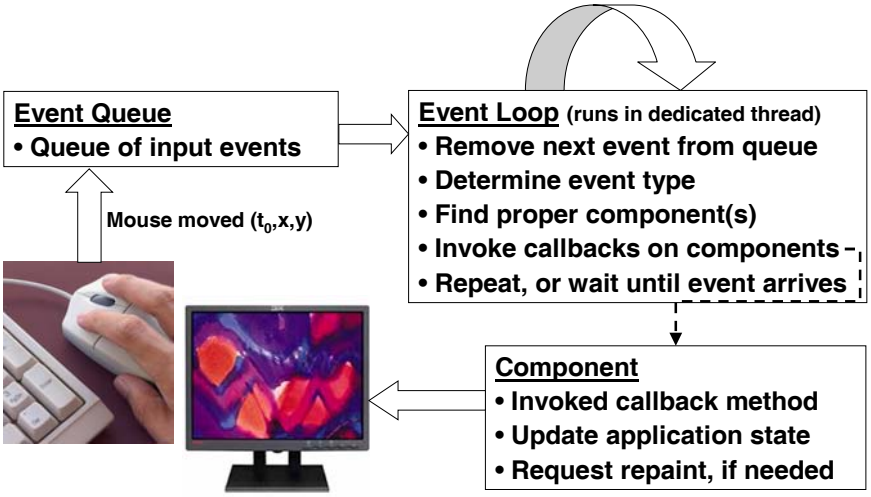
- Mouse input
  - Mouse entered, exited, moved, clicked, dragged
  - Inferred events: double-clicks, gestures
- Keyboard (key down, key up)
- Window movement, resizing

Anatomy of an Event

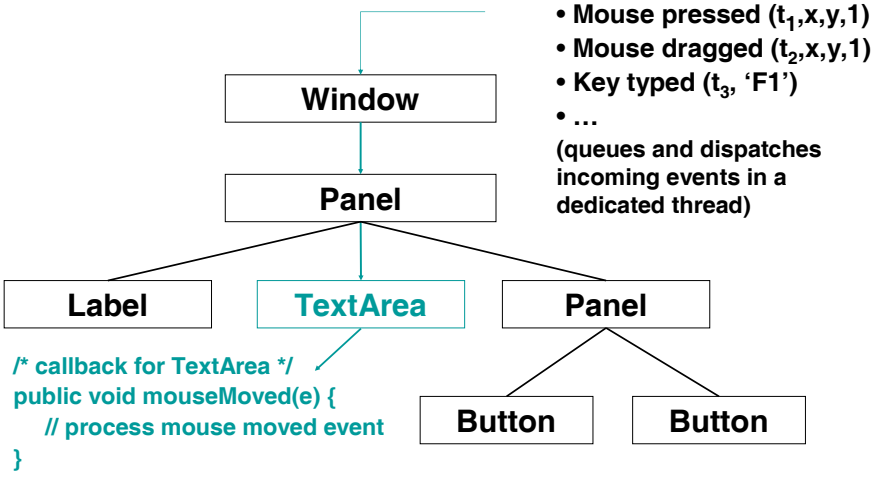
An event encapsulates the information needed for handlers to react to the input

- Event Type (mouse moved, key down, etc)
- Event Source (the input component)
- Timestamp (when did event occur)
- Modifiers (Ctrl, Shift, Alt, etc)
- Event Content
  - Mouse: x,y coordinates, button pressed, # clicks
  - Keyboard: which key was pressed

Event Dispatch Loop



Event Dispatch



Demo

Explore Java's event handling model
Use debugger to walk into Swing internals
Need source from Sun, provided w/ JDK

Model-View-Controller Architecture

Model-View-Controller

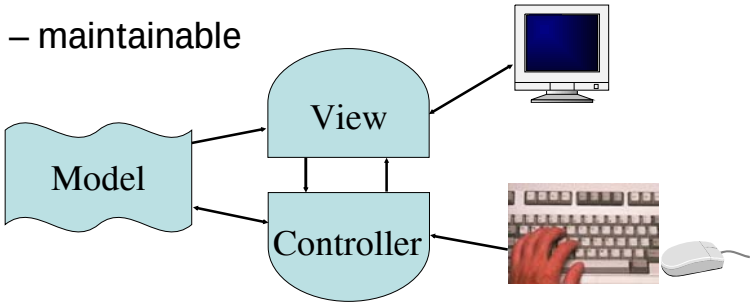
Architecture for interactive apps

– introduced by Smalltalk developers at PARC

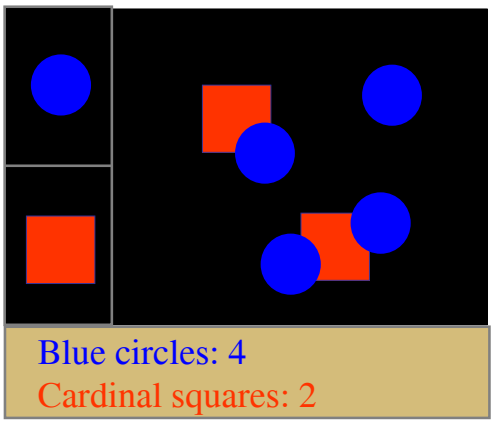
Partitions application in a way that is

– scalable

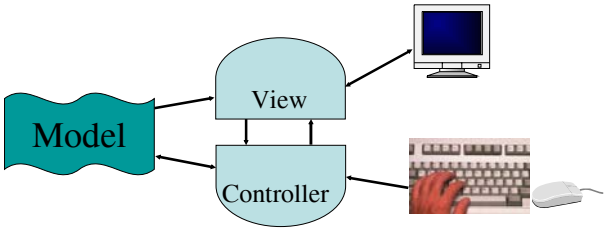
– maintainable



Example Application



Model

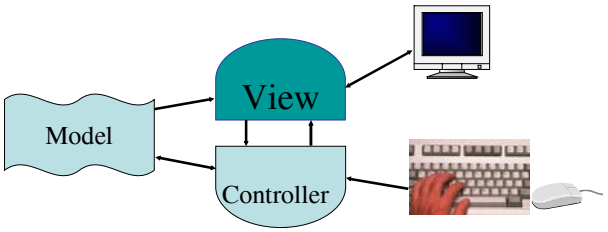


Information the app is trying to manipulate

Representation of real world objects

- circuit for a CAD program
  - logic gates and wires connecting them
- shapes in a drawing program
  - geometry and color

View

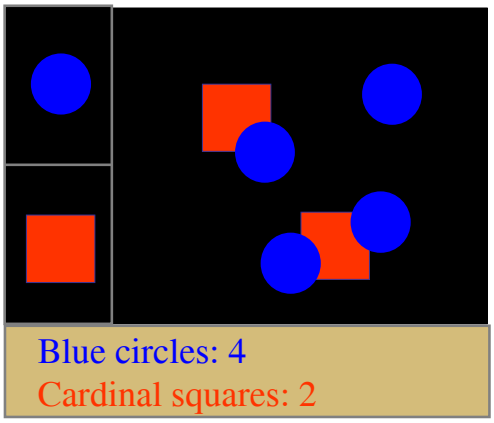


Implements a visual display of the model

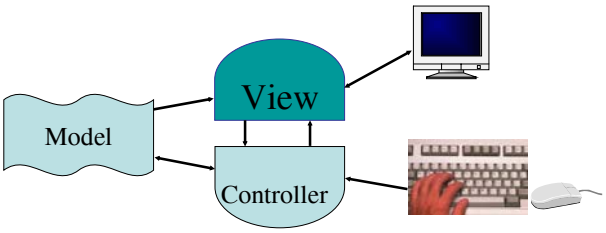
May have multiple views

- e.g., shape view and numerical view

Multiple Views



View



Implements a visual display of the model

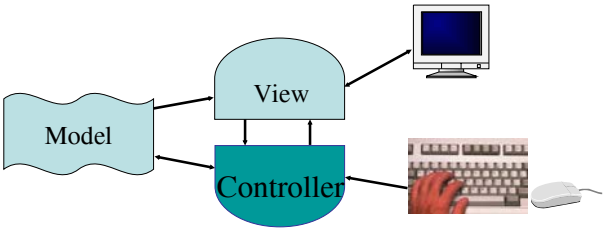
May have multiple views

- e.g., shape view and numerical view

Any time the model is changed, each view must be notified so that it can change *later*

- e.g., adding a new shape

Controller

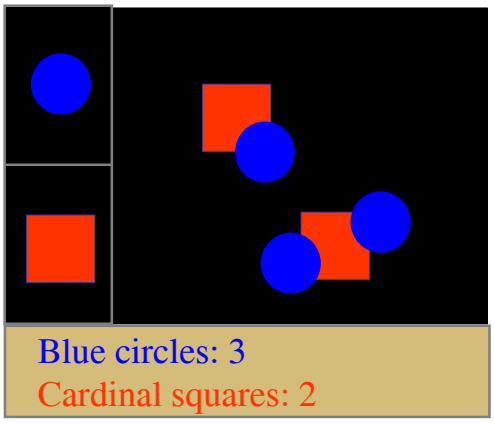


Receives all input events from the user

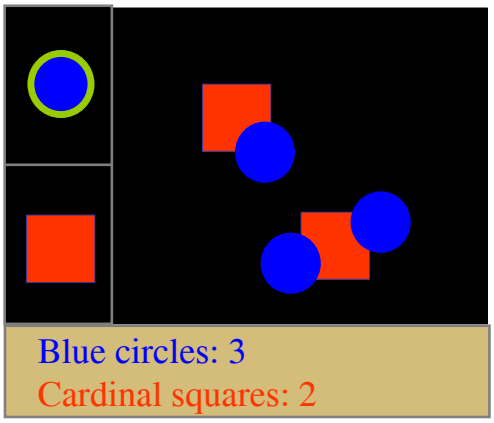
Decides what they mean and what to do

- communicates with view to determine the objects being manipulated (e.g., selection)
- calls model methods to make changes on objects
  - model makes change and notifies views to update

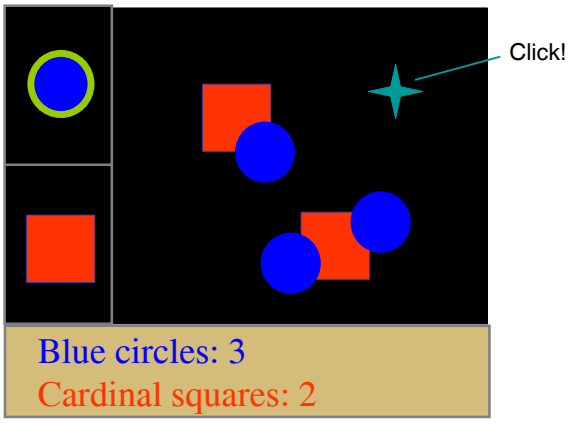
Controller



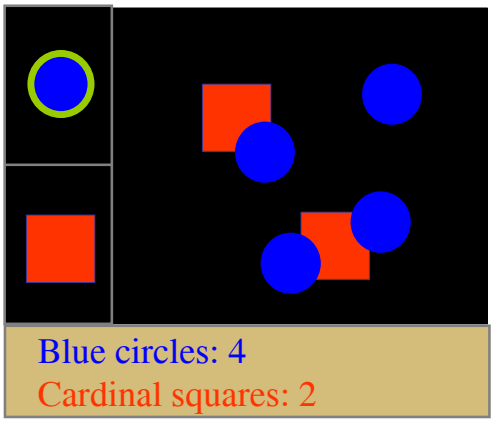
Controller



Controller



Controller



Relationship of View & Controller

"pattern of behavior in response to user events (controller issues) is independent of visual geometry (view issues)"

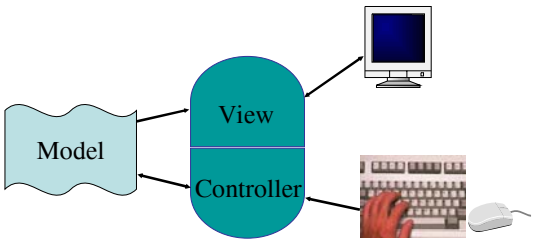
Controller must contact view to interpret what user events mean (e.g., selection)

Combining View & Controller

View and controller are tightly intertwined
- lots of communication between the two

Almost always occur in pairs
- i.e., for each view, need a separate controller

Many architectures combine into a single class

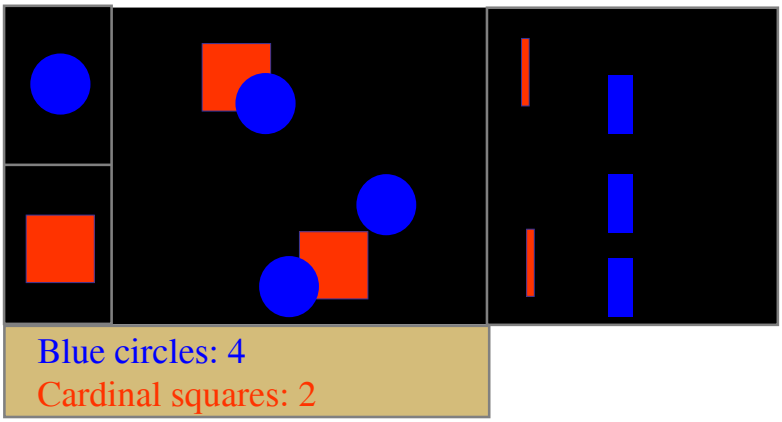


Why MVC?

Combining MVC into one class will not scale
- model may have more than one view
  - each is different and needs update when model changes

Separation eases maintenance and extensibility
- easy to add a new view later
- model info can be extended, but old views still work
- can change a view later, e.g., draw shapes in 3-d (recall, view handles selection)
- flexibility of changing input handling when using separate controllers

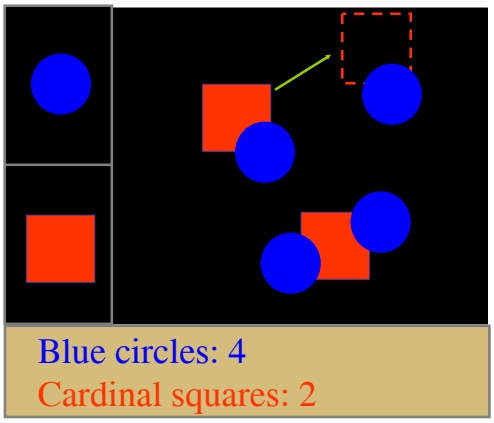
Adding Views Later



Changing the Display

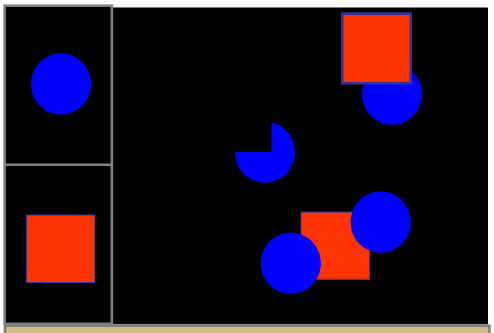
How do we redraw when shape moves?

Moving Cardinal Square



Blue circles: 4
Cardinal squares: 2

Erase w / Background Color and Redraw



Blue circles: 4
Cardinal squares: 2

Changing the Display

Erase and redraw
- using background color to erase fails
- drawing shape in new position loses ordering

Move in model and then redraw view
- change position of shapes in model
- model keeps shapes in a desired order
- tell **all** views to redraw themselves in order
- slow for large / complex drawings
  - flashing! (can solve w/ double buffering)

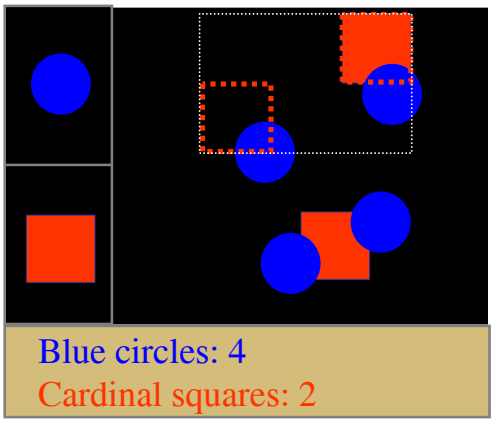
Damage / Redraw Method

View informs windowing system of areas that need to be updated (i.e., *damaged*)
- does not redraw them at this time...

Windowing system
- batches updates
- clips them to *visible* portions of window

Next time waiting for input
- windowing system calls *Repaint* method
  - passes region that needs to be updated

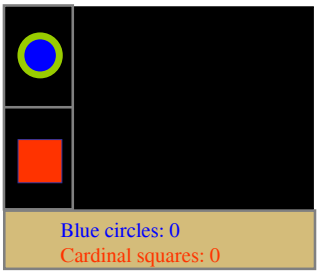
Damage old, Change position in model, Damage new



Event Flow

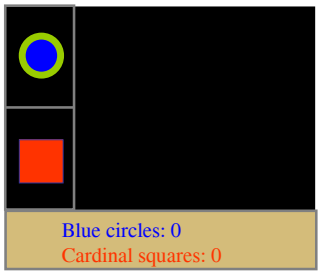
Creating a new shape

Event Flow (cont.)



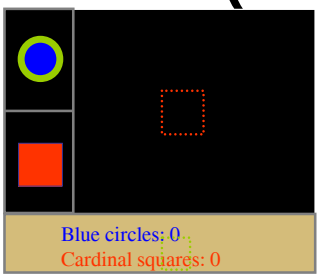
Assume blue circle selected

Event Flow (cont.)



Press mouse over tentative position
Windowing system identifies proper window for event
Controller for drawing area gets mouse click event
Checks mode and sees “circle”
Calls models AddCircle method with new position

Event Flow (cont.)



AddCircle adds new circle to model's list of objects

Model then notifies list of views of change

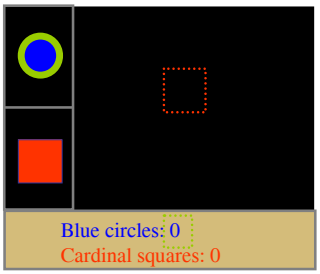
– drawing area view and text summary view

Views notifies windowing system of damage

– both views notify WS without making changes yet!

• model may override

Event Flow (cont.)



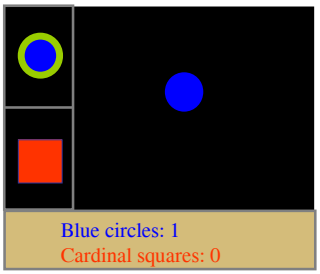
Views return to model, which returns to controller

Controller returns to event handler

Event handler notices damage requests pending and responds

If one of the views was obscured, it would be ignored

Event Flow (cont.)



Event handler calls views' Repaint methods with damaged areas

Views redraw all objects in model that are in damaged area

Dragging at Interactive Speeds

Damage old, move, damage new method may be too slow

- must take less than ~100 ms to be smooth

Solutions

- don't draw object, draw an outline (cartoon)
  - use XOR to erase fast (problems w/ color)
- save portion of frame buffer before dragging
  - draw bitmap rather than redraw the component
- modern hardware often alleviates the problem

Review

Event-Driven Interfaces

- Hierarchy of components or widgets
- Input events dispatched to components
- Components process events with callback methods

Model-View-Controller

- Break up a component into
  - **Model** of the data backing the widget(s)
  - **View** determining the look of the widget
  - **Controller** for handling input events
- Provides scalability and extensibility

Looking forward

- Containment hierarchy model is now over 20 years old, designed in a context of significantly less processing and graphics power.
- Dominant model in use today, and still quite useful, but in many cases limiting.
- Limitations include:
  - Assumes rectangular components
  - Limited support for animation
  - Level of extensibility (varies by toolkit)
- Suitability for next-generation interfaces?
