

# Midterm Review

CSI 60: User Interfaces  
Maneesh Agrawala

## Upcoming Schedule

- Midterm next Tuesday March 18
- Interactive Prototype + Presentations (due Apr 1)
  - First working implementation
  - Can include Wizard of Oz parts where justified

## **Topics**

- Gestalt Principles
- Midterm Review

## **Gestalt Principles**

# Principles

- figure/ground
- proximity
- similarity
- symmetry
- connectedness
- continuity
- closure
- common fate
- transparency

## Figure/Ground

Ambiguous

Principle of surroundedness

Principle of relative size

<http://www.aber.ac.uk/media/Modules/MCI0220/visper06.html>

# Figure/Ground

Ambiguous

Unambiguous

<http://www.aber.ac.uk/media/Modules/MCI0220/visper06.html>

# Proximity

Dots that are near one another are grouped  
Dots that are concentrated are grouped

[from Ware 00]

## Similarity

## Symmetry

Bilateral symmetry gives strong sense of figure [from Ware 04]

# Connectedness

Connectedness overrules proximity, size, color shape [from Ware 04]

# Continuity

We prefer smooth not abrupt changes [from Ware 04]

Connections are clearer with smooth contours [from Ware 04]

## Continuity: Vector Fields

Prefer field that shows smooth continuous contours [from Ware 04]

## Closure

We see a circle behind a rectangle, not a broken circle [from Ware 04]

Illusory contours [from Durand 02]

## Common Fate

Dots moving together are grouped

<http://coe.sdsu.edu/eet/articles/visualperc1/start.htm>

## Transparency

Requires continuity and proper color correspondence [from Ware 04]

## **Summary**

- **Design is about communication, form and function**
  - Simplicity and elegance are keys to good design
  - Minimalism constrains you and reduces chances of bad design
- **Use a small palette of colors**
  - Let others pick them for you ([colorbrewer.org](http://colorbrewer.org))
- **Human vision is organized by Gestalt Principles**
  - Be aware of these principles as you design the visual look

## **Midterm Review**

## General Information

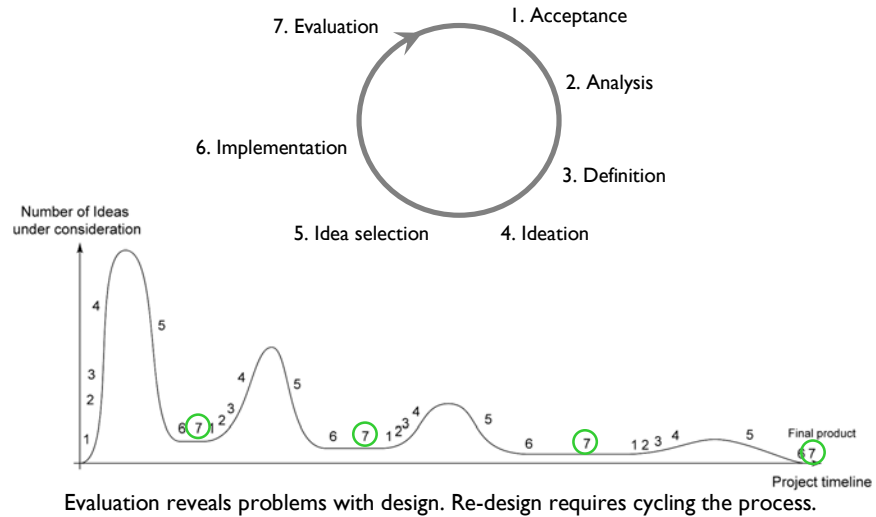

- Closed book, no cheatsheets, no electronic devices
- Format
  - Short answer and longer answer questions
  - Will involve some recall (I know this is bad interface design)
- Test-taking strategy
  - Questions will not be ordered in difficulty
  - Go through entire test, read questions, answer simple ones first
  - Read questions thoroughly
- Covers all material in lectures, sections and readings
  - Lectures mostly go over material in readings
  - Use lectures as guide to most important aspects of readings

## The Design Cycle

[Koberg & Bagnall]

## Design Cycle Over Project Lifespan

## IDEO's Brainstorming Rules

1. Sharpen the Focus
2. Playful Rules
3. Number your Ideas
4. Build and Jump
5. The Space Remembers
6. Stretch Your Mental Muscles
7. Get Physical

**Aim for quantity**

Hope for quality

# Affordances

What is an affordance?

“... the term **affordance** refers to the *perceived* and *actual* properties of the thing, primarily those fundamental properties that determine just how the thing could possibly be used.

Some affordances obvious

- Knobs afford turning
- Buttons afford pushing
- Glass can be seen through

Some affordances learned

- Glass breaks easily
- Floppy disk
  - Rectangular – can't insert sideways
  - Tabs prevent backwards insertion

The Design of Everyday Things. 1988. Don Norman

# Why Mobile Devices Matters

6.5 billion people in the world

- 1.5 billion cell phones worldwide
- 500 million PCs (?)
- 46 million PDAs
- 1 million TabletPCs

Cell phone is the primary medium for communication

**Question:** How can we improve it's interface?

# Key Challenges

- Limited Physical Resources
  - CPU, Memory, Screen Size, Input Devices, Battery Life etc
- Diversified Context of Use
- Different Activities
- Limited Attention

## Comparisons

- Mobile vs. Desktop
- Mobile vs. Laptop
- Mobile vs. Paper Notebook

## Conceptual Models

- What is the user's conceptual model?
- How does the user form the conceptual model?
- What if the designers model doesn't match the user's model?

## Norman's Design Principles

- Make controls visible
- Make sure mapping is clear
- Provide feedback

## Task Analysis Questions

1. Who is going to use system?
2. What tasks do they now perform?
3. What tasks are desired?
4. How are the tasks learned?
5. Where are the tasks performed?
6. What's the relationship between user & data?
7. What other tools does the user have?
8. How do users communicate with each other?
9. How often are the tasks performed?
10. What are the time constraints on the tasks?
11. What happens when things go wrong?

What is the purpose of task analysis?

# Master-Apprentice Model

Allows user to teach us what they do

- Master (user) works & talks
- We interrupt to ask questions as they go
- Each step reminds master of the next
  - Better than asking user to summarize work habits

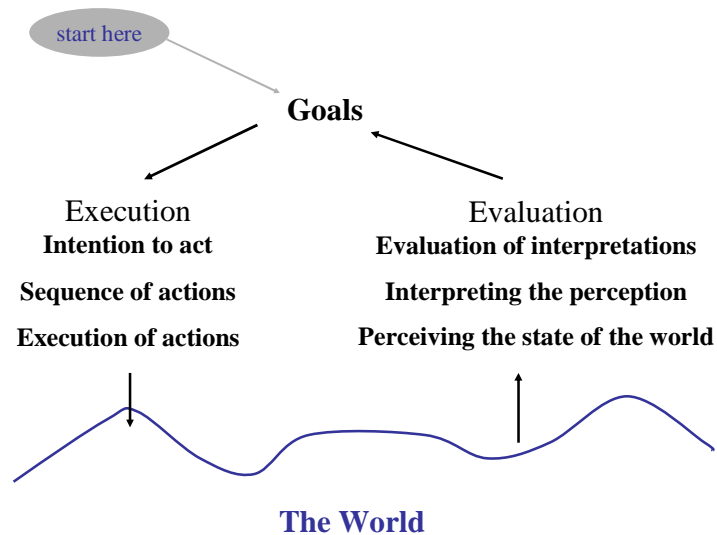

What are other models?

How do other models compare?

What is a persona?

# Action Cycle

# Metaphor

## Definition

The transference of the relation between one set of objects to another set for the purpose of brief explanation

## Examples?

When are they effective?

When are they not effective?

# Direct Manipulation

## Direct Manipulation

- An interface that behaves as though the interaction was with a real-world object rather than with an abstract system

## Central ideas

- Visibility of the objects of interest
- Rapid, reversible, incremental actions
- Manipulation by pointing and moving
- Immediate and continuous feedback

# Semantic & Articulatory Distance

# Cognition

## Cognetics

- Ergonomics of the mind
- What does that mean?

## Cognitive Conscious/Unconscious

- What are they?

## Locus of Attention

- What is it?
- Why locus rather than focus?

Jef Raskin

# Modes

## Definition

- The same user actions have different effects in different situations

# Noun-Verb VS Verb-Noun

Noun-Verb: Select object, *then* perform action

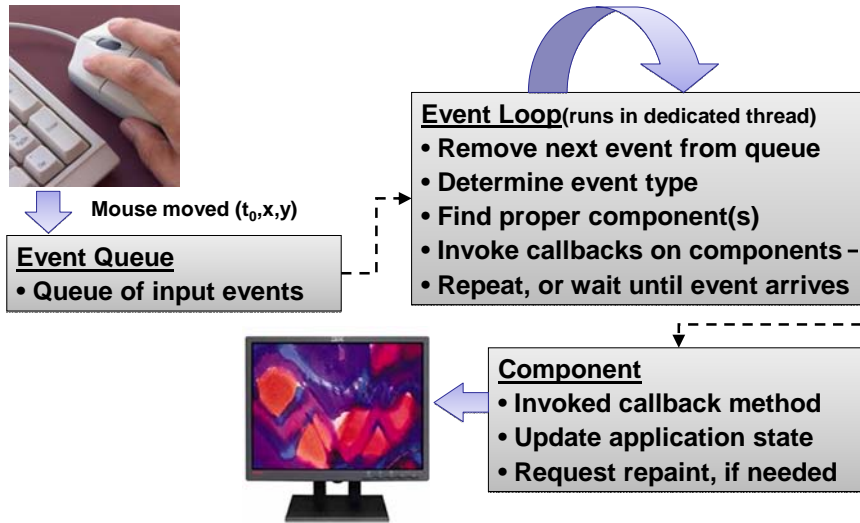

Verb-Noun: Select action, then perform it on object

What are some examples of these two approaches?

What are the pros and cons of these two approaches?

# Event Driven Interfaces

# Model-View-Controller

Architecture for interactive apps

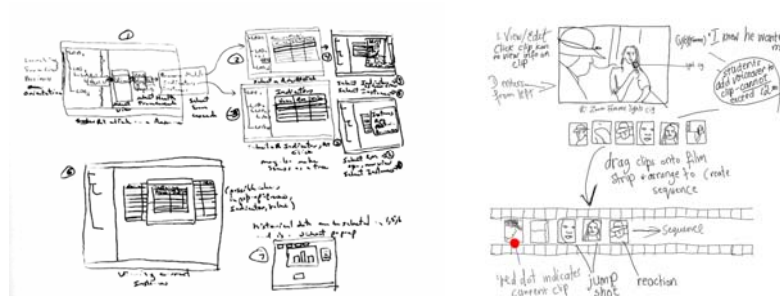

- Model: Info the application manipulates
- View: Visual display of the model
- Controller: Receives input & decides what they do

# Storyboarding

Series of key frames depicting key steps in reaching a goal

- Can use a pin board for easy rearrangement/editing
- Describe the interaction in context
- Often useful to show user in at least 1<sup>st</sup> frame (establishing shot)

# Fidelity in Prototyping

Fidelity refers to the level of detail

High fidelity:

- Prototypes look like the final product

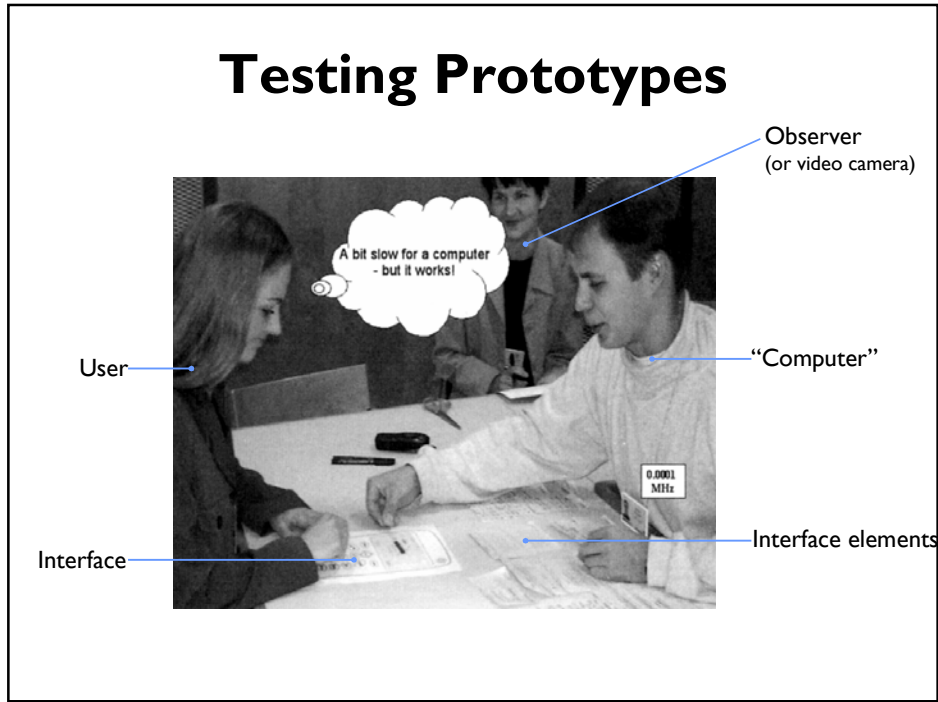

Low fidelity:

- Artists renditions with many details missing

Why do we create prototypes?

# Testing Prototypes

# Model Human Info Processor

## 5 Parts

- Perceptual
- Cognitive
- Motor
- Working memory
- Long-term memory

## Unified model

- Probably inaccurate
- Predicts perf. well
- Very influential

# Review: Memory

Working memory is small

- Temporary storage
  - decay
  - displacement

Long term memory

- Rehearsal
- Relate new to learned material
- Link to existing knowledge
- Attach meaning
  - Make a story

Design interface to facilitate retrieval

- Recognition rather than recall

# Review: Pop-Out and Causality

**Michotte demonstration 1.** What do you see? Most observers report that "the red ball hit the blue ball." The blue ball moved "because the red ball hit it." Thus, the red ball is perceived to "cause" the blue ball to move, even though the balls are nothing more than color disks on your screen that move according to a programme.

# Recognition over Recall

## Recall

- Information reproduced from memory

## Recognition

- Presentation of info helps retrieve info (helps remember it was seen before)
- Easier because of cues to retrieval

# Decision Making

Hick's Law – cost of taking a decision:

$$T = a + b \log_2(n + 1)$$

- Time depends on number of options
  - Choosing a movie at Blockbuster

# Power Law of Practice

Task time on the nth trial follows a power law

$$T_n = T_1 n^{-a} + c$$

where  $a = .4$ ,  $c =$  limiting constant

Applies to skilled behavior

- Sensory
- Motor

# Fitts' Law

Hand movement based on series of microcorrections

$X_i$  = remaining distance after  $i$ th move  
 relative movement accuracy remains constant  $\rightarrow \frac{X_i}{X_{i-1}} = \epsilon$

Then

$$T = I_m \log_2 \left( \frac{2D}{S} \right)$$

# Fitts' Law

$$T = a + b \log_2(D/S + 1)$$

a, b = constants (empirically derived)

D = distance

S = size

ID is Index of Difficulty =  $\log_2(D/S + 1)$

- Models well-rehearsed selection task
- T increases as the **distance** to the target increases
- T decreases as the **size** of the target increases

\* Expansion of MOVE-TEXT goal

GOAL: MOVE-TEXT	
• GOAL: CUT-TEXT	
• GOAL: HIGHLIGHT-TEXT	
• [select**]: GOAL: HIGHLIGHT-PHRASE-COMPOSED-OF-WORDS	
• MOVE-CURSOR-TO-FIRST-WORD	1.10
• DOUBLE-CLICK-MOUSE-BUTTON	0.40
• MOVE-CURSOR-TO-LAST-WORD	1.10
• SHIFT-CLICK-MOUSE-BUTTON	0.40
• VERIFY-HIGHLIGHT	1.35
• GOAL: HIGHLIGHT-ARBITRARY-TEXT	
• MOVE-CURSOR-TO-BEGINNING-OF-TEXT	
• PRESS-MOUSE-BUTTON	
• MOVE-CURSOR-TO-END-OF-TEXT	
• RELEASE-CLICK-MOUSE-BUTTON	
• VERIFY-HIGHLIGHT]	
• GOAL: ISSUE-CUT-COMMAND	
• MOVE-CURSOR-TO-EDIT-MENU	1.10
• CLICK-MOUSE-BUTTON	0.20
• MOVE-CURSOR-TO-CUT-ITEM	1.10
• VERIFY-HIGHLIGHT	1.35
• CLICK-MOUSE-BUTTON	0.20
• GOAL: PASTE-TEXT	
• GOAL: POSITION-CURSOR-AT-INSERTION-POINT	
• MOVE-CURSOR-TO-INSERTION-POINT	1.10
• CLICK-MOUSE-BUTTON	0.20
• VERIFY-POSITION	1.35
• GOAL: ISSUE-PASTE-COMMAND	
• MOVE-CURSOR-TO-EDIT-MENU	1.10
• CLICK-MOUSE-BUTTON	0.20
• MOVE-CURSOR-TO-PASTE-ITEM	1.10
• VERIFY-HIGHLIGHT	1.35
• CLICK-MOUSE-BUTTON	0.20
TOTAL TIME PREDICTED (SEC)	16.25

*Is all this feedback in order?*

*Issuing commands will be used a lot! Can we shorten this procedure? Consider keyboard shortcuts.*

# KLM

Describe the task using the following operators:

- K: pressing a key or a pressing (or releasing) a button  
 $t_K = 0.08 - 1.2s$  (0.2 good rule of thumb)
- P: pointing  
 $t_P = 1.1s$  (without button press)
- H: Homing (switching device)  
 $t_H = 0.4s$
- D(n,l): Drawing segmented lines  
 $t_D = 0.9*n + .16*l$
- M: Mentally prepare  
 $t_M = 1.35s$
- R(t): system response time  
 $t_R = t$

## GOMS Advantages/Disadvantages

### Advantages

- Gives qualitative & quantitative measures
- Model explains the results
- Less work than user study – no users!
- Easy to modify when UI is revised

### Disadvantages

- Not as easy as other evaluation methods
  - Heuristic evaluation, guidelines, etc.
- Takes lots of time, skill, & effort
- Only works for goal-directed tasks
- Assumes tasks **expert** performance without **error**
- Does not address several UI issues,
  - readability, memorizability of icons, commands

## Usability Heuristics

“Rules of thumb” describing features of usable systems

- Can be used as design principles
- Can be used to evaluate a design

Example: *Minimize users’ memory load*

Pros and cons

- Easy and inexpensive
  - Performed by experts
  - No users required
  - Catch many design flaws
- More difficult than it seems
  - Not a simple checklist
  - Cannot assess how well the interface will address user goals

## Phases of Heuristic Eval. (1-2)

1) Pre-evaluation training

- Provide the evaluator with domain knowledge if needed

2) Evaluation

- Individuals evaluate interface then aggregate results
  - Compare interface elements with heuristics
- Work in 2 passes
  - First pass: get a feel for flow and scope
  - Second pass: focus on specific elements
- Each evaluator produces list of problems
  - Explain why with reference to heuristic or other information
  - Be specific and list each problem separately

## Phases of Heuristic Eval. (3-4)

### 3) Severity rating

- Establishes a ranking between problems
  - Cosmetic, minor, major and catastrophic
- First rate individually, then as a group

### 4) Debriefing

- Discuss outcome with design team
- Suggest potential solutions
- Assess how hard things are to fix

## Review: Managing Participants

- Testing is distressing
- Treat participants with respect
  - Follow human subjects protocol
  - Obtain informed consent
  - Make sure experiment is ethical

## Steps in Designing an Experiment

1. State a lucid, testable hypothesis
2. Identify variables (independent, dependent control, random)
3. Design the experimental protocol
4. Choose user population
5. Apply for human subjects protocol review
6. Run pilot studies
7. Run the experiment
8. Perform statistical analysis
9. Draw conclusions

## Experiment Design

### Testable hypothesis

- Precise statement of expected outcome

### Factors (independent variables)

- Attributes we manipulate/vary in each condition
- Levels – values for independent variables

### Response variables (dependent variables)

- Outcome of experiment (measurements)
- Usually measure user performance
  - Time
  - Errors

# Experiment Design

## Control variables

- Attributes that will be fixed throughout experiment
- Confound – attribute that varied and was not accounted for
  - Problem: Confound rather than IV could have caused change in DVs
- Confounds make it difficult/impossible to draw conclusions

## Random variables

- Attributes that are randomly sampled
- Increases generalizability

# Between vs. Within Subjects

## Between subjects

- Each participant uses one condition
  - +/- Participants cannot compare conditions
  - + Can collect more data for a given condition
  - - Need more participants

## Within subjects

- All participants try all conditions
  - + Compare one person across conditions to isolate effects of individual diffs
  - + Requires fewer participants
  - - Fatigue effects
  - - Bias due to ordering/learning effects

## Results: Statistical Analysis

Compute central tendencies (descriptive summary statistics) for each independent variable

- Mean
- Standard deviation

## Are the Results Meaningful?

Hypothesis testing

- **Hypothesis:** Manipulation of IV effects DV in some way
- **Null hypothesis:** Manipulation of IV has no effect on DV
- Null hypothesis assumed true unless statistics allow us to reject it

Statistical significance (p value)

- Likelihood that results are due to chance variation
- $p < 0.05$  usually considered significant (Sometimes  $p < 0.01$ )
  - Means that  $< 5\%$  chance that null hypothesis is true

Statistical tests

- T-test (1 factor, 2 levels)
- Correlation
- ANOVA (1 factor,  $> 2$  levels, multiple factors)
- MANOVA ( $> 1$  dependent variable)

Explaining Psychological Statistics  
Barry H. Cohen

## **Next Time**

Midterm Exam
