Plan Through Midterm

Today 3/7:

Statistics & Analyzing Study Data

Monday 3/12:

Midterm Review

Due: Lo-fi test with three users

Wednesday 3/14:

In-class Midterm

Midterm on 3/14

In class. 75 minutes

Closed book & notes

Review on Monday 3/12

If you are registered with the DSP office and have special needs, we need to see your letter by **today** at 1pm to make accommodations.

Designing Controlled Experiments

Variables

Independent variables

Cursor type (bubble, normal, area?)
 Target Distance
 Target Width (Effective vs. Actual?)

Dependent variables

Movement Time
 Error Rate
 User Satisfaction

Control variables

Color scheme, input device,
 screen size

Random variables

Location, environment,
 Attributes of subjects
 Age, gender, handedness, ...

Conducting studies online vs. in person strongly influences which variables are controlled and which are random.

Choosing Subjects

Pick balanced sample reflecting intended user population

Novices, experts

Age group

Sex

....

Example

12 non-colorblind right-handed adults (male & female)

Population group can also be an IV or a controlled variable

What is the disadvantage of making population a controlled var?

Between Subjects Design

Wilma and Betty use one interface

Dino and Fred use the other

Within Subjects Design

Everyone uses both interfaces

Between vs. Within Subjects

Between subjects

Each participant uses one condition

- +/- Participants cannot compare conditions
- + Can collect more data for a given condition
- Need more participants

Within subjects

All participants try all conditions

- + Compare one person across conditions to isolate effects of individual diffs
- + Requires fewer participants
- Fatigue effects
- Bias due to ordering/learning effects

Within Subjects: Ordering Effects

In within-subjects designs ordering of conditions is a variable that can confound results

Why?

Turn it into a random variable

Randomize order of conditions across subjects

Counterbalancing (ensure all orderings are covered)

Latin square (partial counterbalancing)

...

Run the Experiment

Always pilot it first!

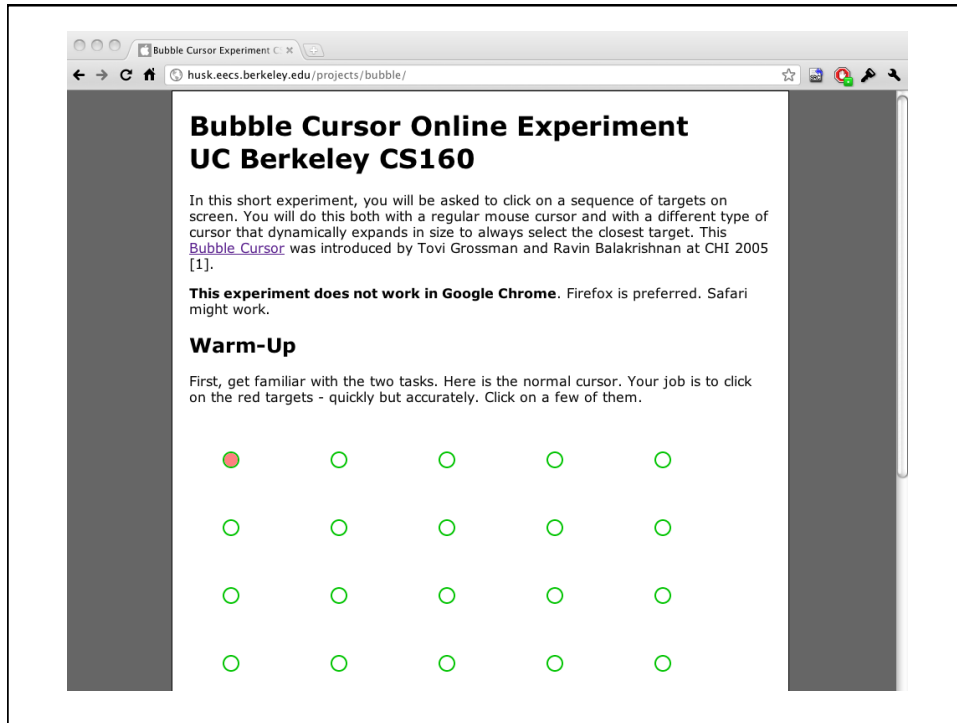

Reveals unexpected problems

Can't change experiment design after starting it

Always follow same steps – use a checklist

Get consent from subjects

Debrief subjects afterwards

Run the Experiment

Always pilot it first!

Reveals unexpected problems

Can't change experiment design after starting it

Always follow same steps – use a checklist

Get consent from subjects

Debrief subjects afterwards

The Participants' Standpoint

Testing is a distressing experience

Pressure to perform

Feeling of inadequacy

Looking like a fool in

front of

your peers, your boss, ...

(from "Paper Prototyping" by Snyder)

The Three Belmont Principles

Respect for Persons

Have a meaningful consent process: give information, and let prospective subjects freely choose to participate

Beneficence

Minimize the risk of harm to subjects, maximize potential benefits

Justice

Use fair procedures to select subjects
(balance burdens & benefits)

To ensure adherence to principles, most schools require Institutional Review Board approval of research involving human subjects.

Ethics: Stanford Prison Experiment

1971 Experiment by Phil Zimbardo at Stanford

24 Participants – half prisoners, half guards (\$15 a day)

Basement of Stanford Psychology bldg turned into mock prison

Guards given batons, military style uniform, mirror glasses,...

Prisoners wore smocks (no underwear), thong sandals, pantyhose caps

Experiment quickly got out of hand

Prisoners suffered and accepted sadistic treatment

Prison became unsanitary/inhospitable

Prisoner riot put down with use of fire extinguishers

Guards volunteered to work extra hours

Zimbardo terminated experiment early

Grad student Christina Maslach objected to experiment

Important to check protocol with ethics review boards

[from Wikipedia]

Ethics: Stanford Prison Exp. Video

<http://www.youtube.com/watch?v=Z0jYx8nwjFQ>

Ethics (more recently)

“In 2001, a faculty member [...] designed a study to see how restaurants would respond to complaints [...]

As part of the project, the researcher sent letters to restaurants falsely claiming that he and/or his wife had suffered food poisoning that ruined their anniversary celebration.

The letters [...] stated that the only intent was to convey to the owner what had occurred "in anticipation that you will respond accordingly."

Restaurant owners were understandably upset and some employees lost their jobs before it was revealed that the letter was a hoax.“

CITI Human Subject Training Material

Beneficence: Example

MERL DiamondTouch:

User capacitively coupled to table through seating pad.

No danger for normal users, but possibly increased risk for participants with pacemakers.

Inform subjects in consent!

<http://www.merl.com/projects/images/DiamondTouch.jpg>

Privacy and Confidentiality

Privacy: having control over the extent, timing, and circumstances of sharing oneself with others.

Confidentiality: the treatment of information that an individual has disclosed with the expectation that it will not be divulged

Examples where privacy could be violated or confidentiality may be breached in HCI studies?

Treating Subjects With Respect

Follow human subject protocols

- Individual test results will be kept confidential
- Users can stop the test at any time
- Users are aware (and understand) the monitoring technique(s)
- Their performance will not have implications on their life
- Records will be made anonymous

Use standard informed consent form

- Especially for quantitative tests
- Be aware of legal requirements

Conducting the Experiment

Before the experiment

- Have them read and sign the consent form
- Explain the goal of the experiment in a way accessible to users
- Be careful about the demand characteristic (Participants biased towards experimenter's hypothesis)
- Answer questions

During the experiment

- Stay neutral
- Never indicate displeasure with users performance

After the experiment

- Debrief users (Inform users about the goal of the experiment)
- Answer any questions they have

Managing Subjects

Don't waste users' time

Use pilot tests to debug experiments, questionnaires, etc...

Have everything ready before users show up

Make users comfortable

Keep a relaxed atmosphere

Allow for breaks

Pace tasks correctly

Stop the test if it becomes too unpleasant

If you want to learn more...

Bubble Cursor Online Experiment
UC Berkeley CS160

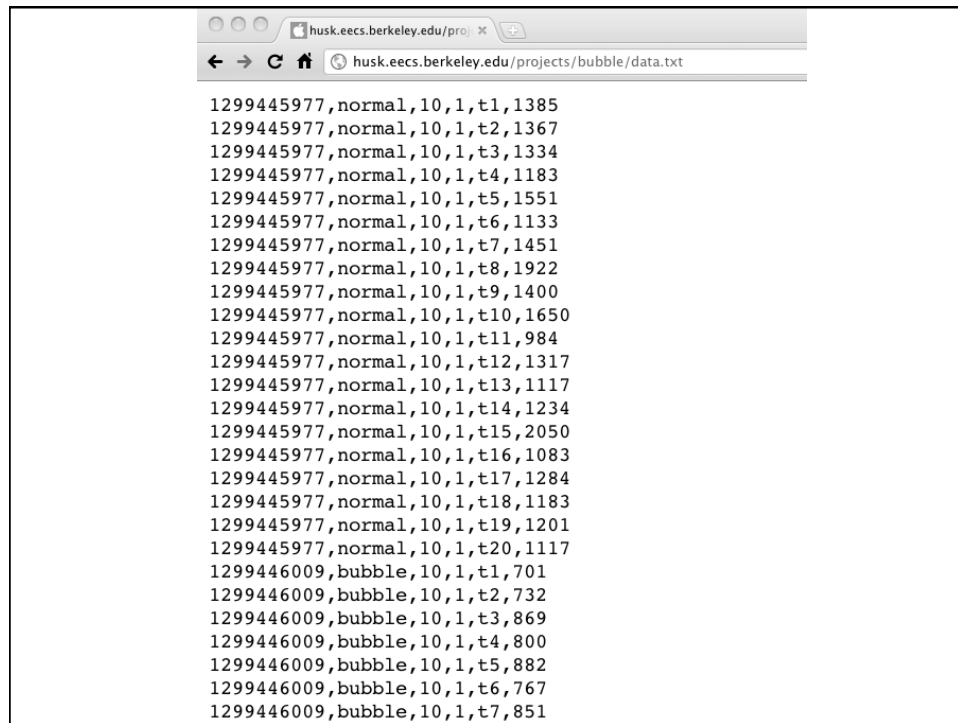

In this short experiment, you will be asked to click on a sequence of targets on screen. You will do this both with a regular mouse cursor and with a different type of cursor that dynamically expands in size to always select the closest target. This [Bubble Cursor](#) was introduced by Tovi Grossman and Ravin Balakrishnan at CHI 2005 [1].

This experiment does not work in Google Chrome. Firefox is preferred. Safari might work.

Warm-Up

First, get familiar with the two tasks. Here is the normal cursor. Your job is to click on the red targets - quickly but accurately. Click on a few of them.

A screenshot of a web browser window. The address bar shows the URL `husk.eecs.berkeley.edu/projects/bubble/data.txt`. The page content consists of a list of 35 lines of text, each representing a trial. The first 20 lines are for the 'normal' condition, and the last 7 lines are for the 'bubble' condition. Each line contains a trial ID, a condition name, a number of trials, a time label, and a time value.

Start by counting

1700 trials total

normal: mean time 966.3 ms, mean errors 1.286

bubble: mean time 758.8 ms, mean errors 0.279

Start by counting

21 users completed condition normal, size 10
 mean time: 1129.37 ms, mean errors: 0.08
 median time: 1055 ms, median errors: 0

21 users completed condition normal, size 30
 mean time: 803.24 ms, mean errors: 0.05
 median time: 766 ms, median errors: 0

21 users completed condition bubble, size 10
 mean time: 796.22 ms, mean errors: 0.01
 median time: 751 ms, median errors: 0

22 users completed condition bubble, size 30
 mean time: 723.04 ms, mean errors: 0.02
 median time: 701 ms, median errors: 0

Descriptive Statistics

Continuous data:

Central tendency

mean, median, mode

Dispersion

Range (max-min)

Standard deviation

Shape of distribution

Skew, Kurtosis

Categorical data:

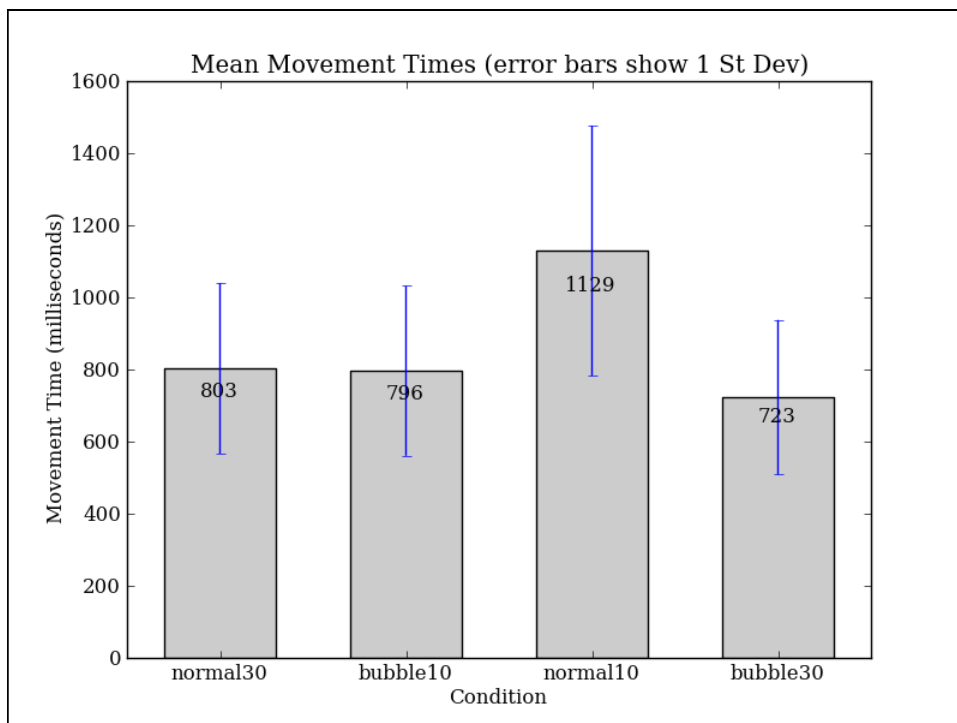

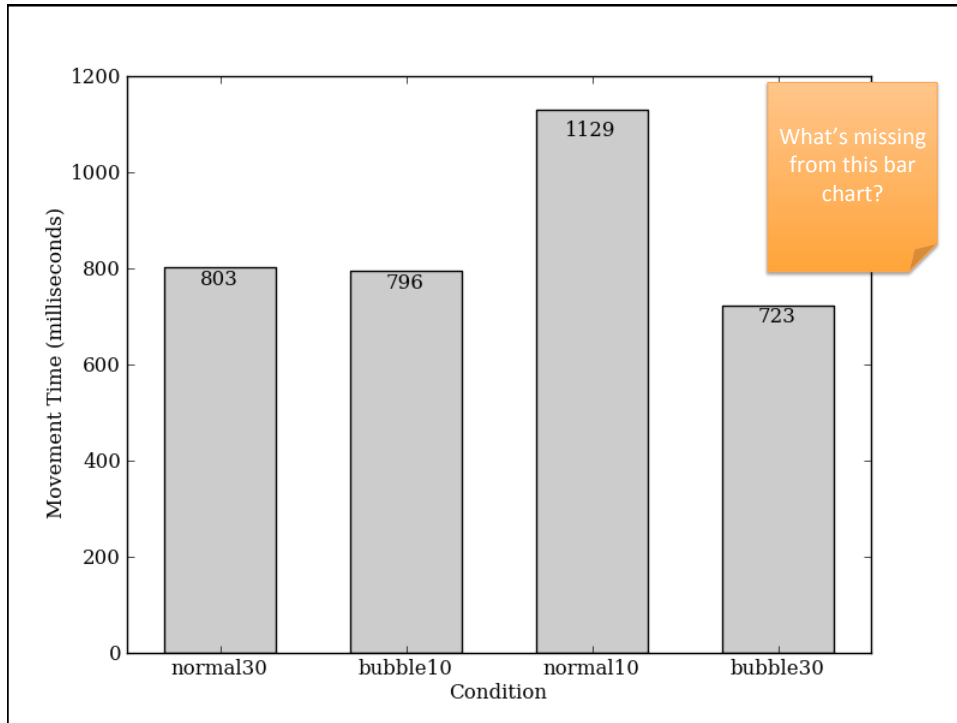

Frequency distributions

$$\mu = \frac{\sum_{i=1}^N X_i}{N}$$

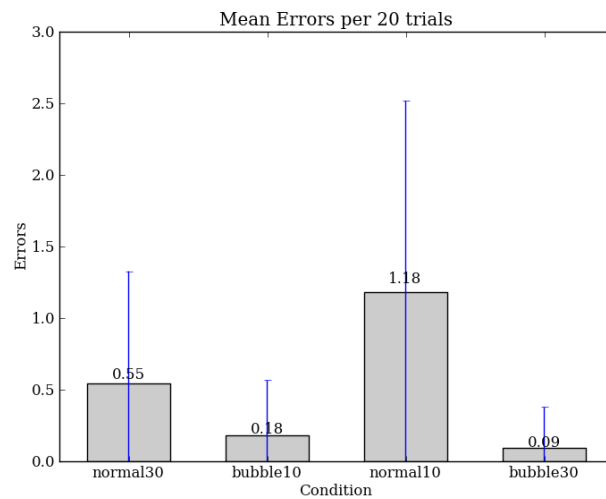

Mean

$$\sigma = \sqrt{\frac{\sum (X_i - \mu)^2}{N}}$$

Standard Deviation

Descriptive Statistics for Error

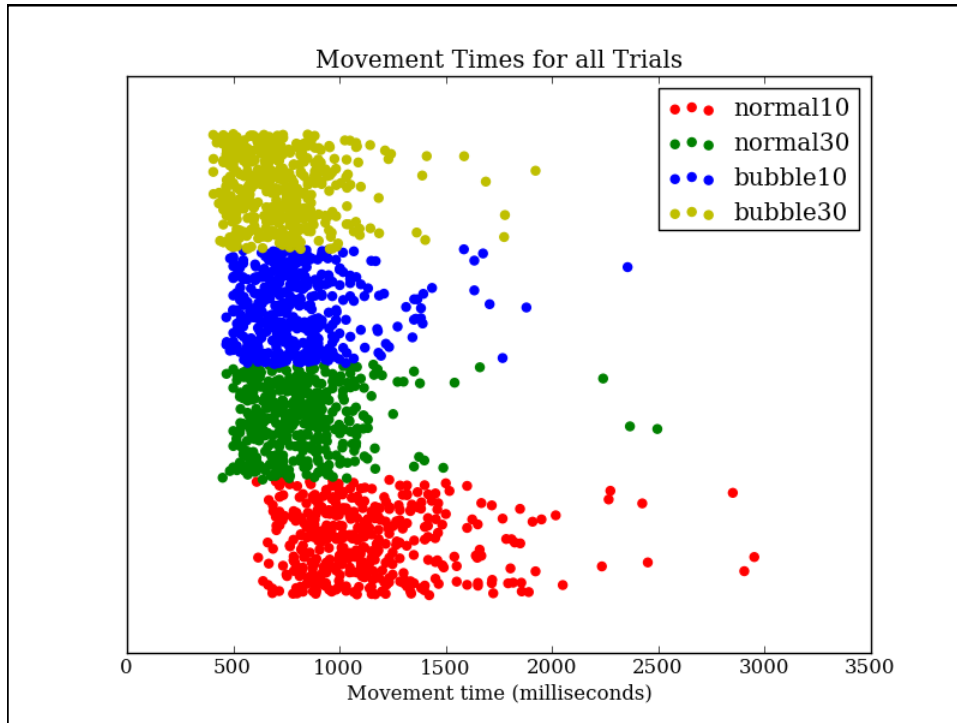

Understanding Your Data

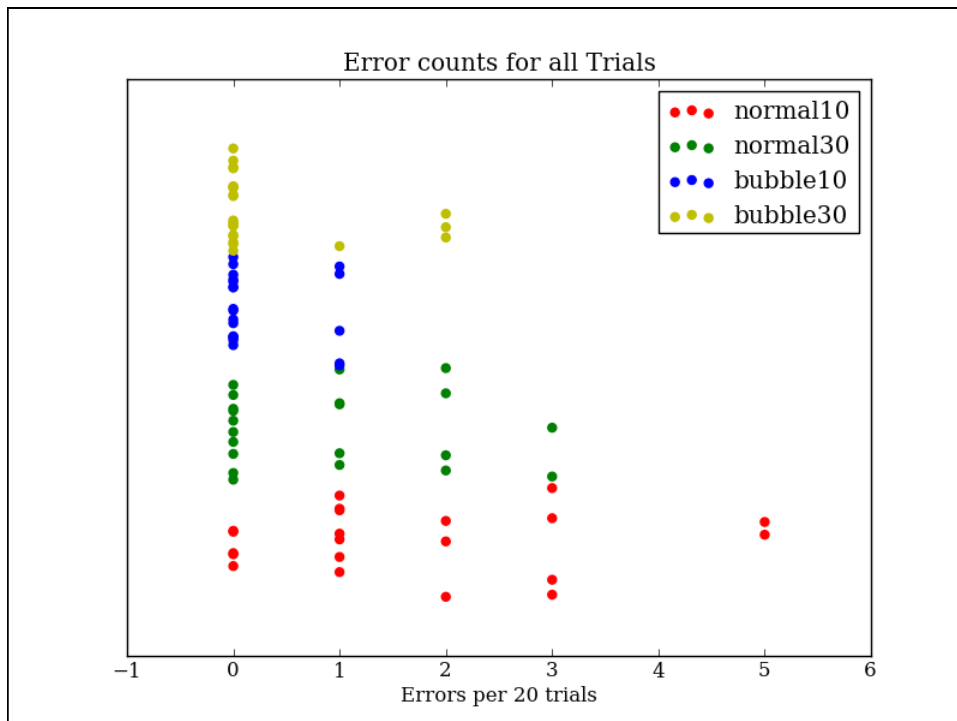

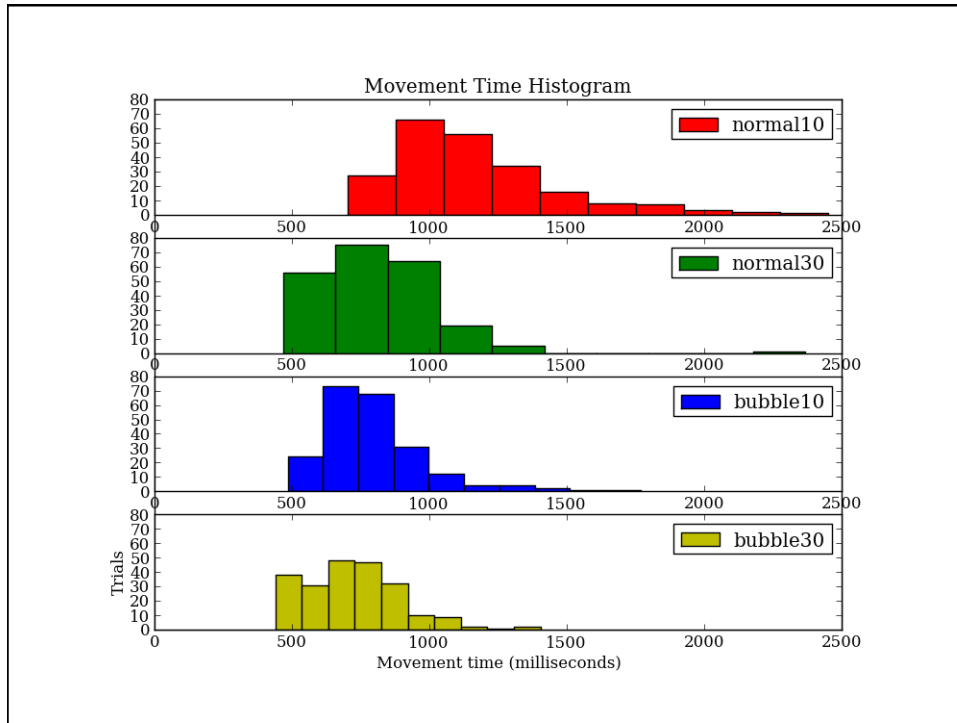

Exploratory Data Analysis (EDA):

Look at your data from different perspectives to get better intuition for it.

Show the raw data!

Use different visualizations: Histograms, scatterplots, box plots, ...

Median vs. Mean

For normal distribution, median = mean

Most data is fitted to normal distribution so median and mean may differ

When data has outliers median more robust

Many data sets gathered online are strongly skewed (they exhibit **power law distributions** - "long tails")

Outliers pull the mean to the right/left
(mean of true power law distribution = ∞)

Power Law Distributions

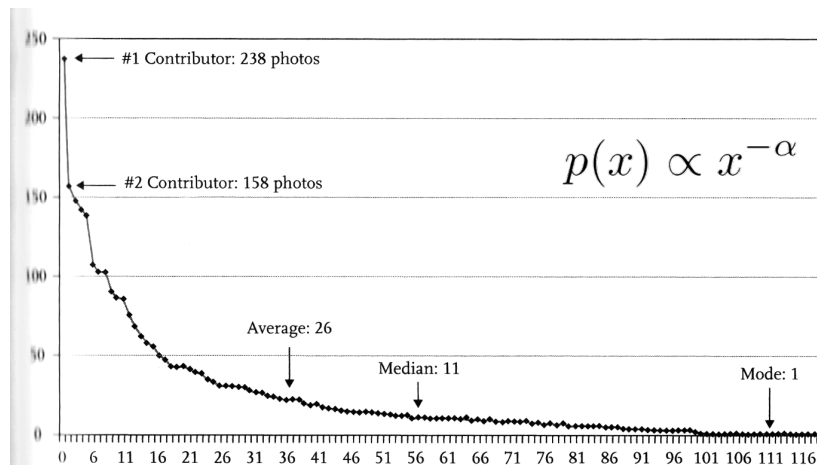

Figure 5-1: The distribution of photographers contributing photos of the 2005 Coney Island Mermaid Parade.

From C. Shirky, Here Comes Everybody

Cleaning Data

Don't discard data just because it doesn't fit your expectation! Maybe your assumptions were wrong.

In online experiments, discarding extreme outliers can make sense if you believe they reflect users not following normal task protocol (e.g., multitasking in a reaction-time study)

Effect Sizes: Time

Normal vs. Bubble cursor at target size 10:

1129ms vs. 796ms: Bubble cursor 30% faster

Normal vs. Bubble cursor at target size 30:

803ms vs. 723ms: Bubble cursor 10% faster

Target size for normal cursor:

1129ms vs 803ms: Larger targets 29% faster

Target size for Bubble cursor:

796ms vs. 723ms: Larger targets 9% faster

Effect Sizes: Time

Descriptive Statistics			
Factor	Group	Sample size	Mean
CURSOR x SIZE	bubble x 10	420	796.21905
CURSOR x SIZE	bubble x 30	440	723.03864
CURSOR x SIZE	normal x 10	420	1,129.36667
CURSOR x SIZE	normal x 30	420	803.2381
CURSOR	bubble	860	758.77791
CURSOR	normal	840	966.30238
SIZE	10	840	962.79286
SIZE	30	860	762.20581

Effect Sizes: Error

Normal vs. Bubble cursor, target size 10:

1.67 vs. 0.24 Errors per 20 trials: 85% fewer errors!
(6.95x)

Normal vs. Bubble cursor, target size 30:

0.90 vs. 0.02 Errors per 20 trials: 98% fewer errors!

Effect Sizes: Error

Descriptive Statistics			
Factor	Group	Sample size	Mean
CURSOR x SIZE	NORMAL x 10	21	1.66667
CURSOR x SIZE	NORMAL x 30	21	0.90476
CURSOR x SIZE	BUBBLE x 10	21	0.2381
CURSOR x SIZE	BUBBLE x 30	22	0.31818
CURSOR	NORMAL	42	1.28571

SIZE	10	42	0.95238
SIZE	30	43	0.60465

Example of Interactions

Group problem solving

Independent variable: Leadership

[from Martin 04]

Example of Interactions

Group problem solving

Independent variable: Leadership

Independent variable: Group size

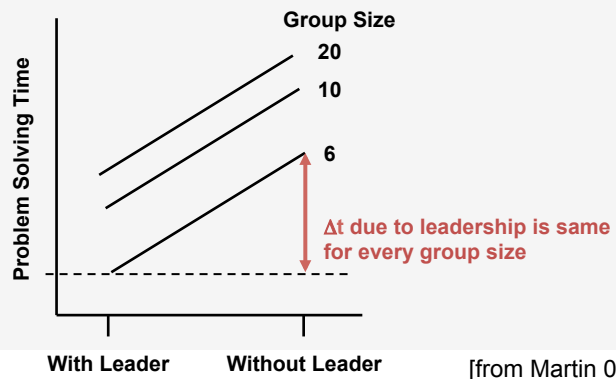

[from Martin 04]

Example of Interactions

Group problem solving

Change in time due to leadership is same regardless of group size

[from Martin 04]

Example of Interactions

Group problem solving

Change in time due to leadership is same regardless of group size

Change in time due to group size is same regardless of leadership

Independent variables do not interact

Example of Interactions

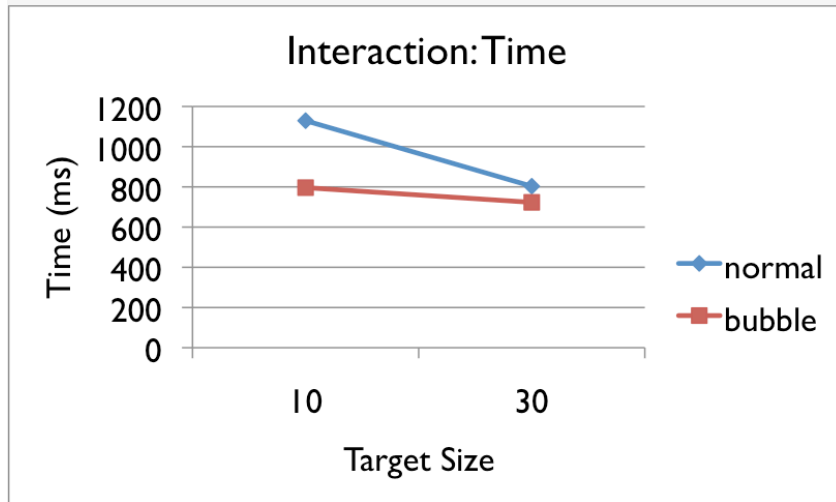

Multiple IVs effect DV non-additively

Change in time due to leadership differs with changes in group size

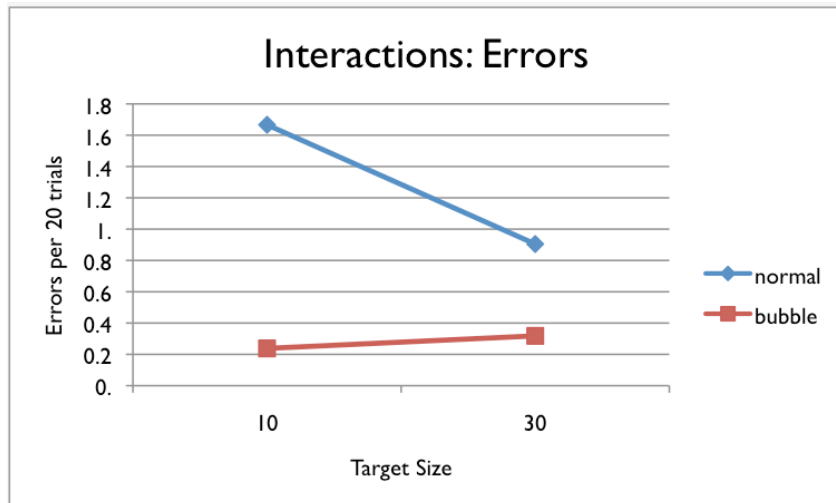

Independent variables do interact

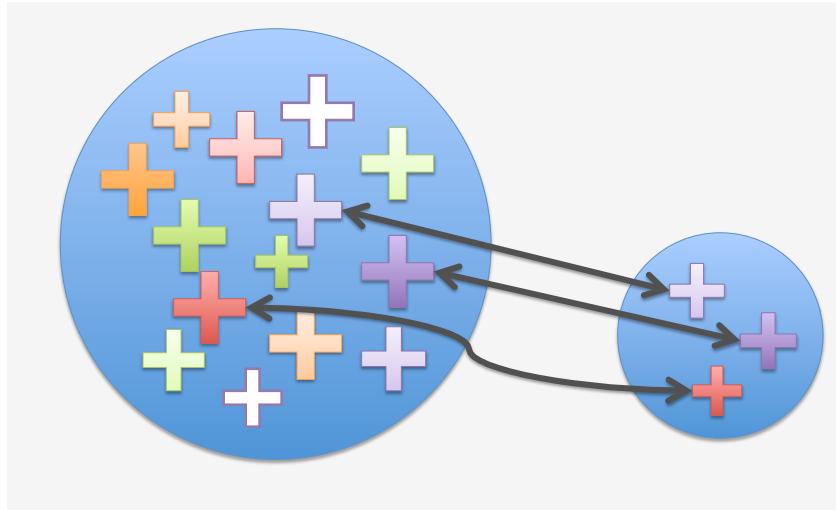

Interactions

Interactions

Population versus Sample

Are the Results Meaningful?

Hypothesis testing

Hypothesis: Manipulation of IV effects DV in some way

Null hypothesis: Manipulation of IV has no effect on DV

Null hypothesis assumed true unless statistics allow us to reject it

Statistical significance (p value)

Likelihood that results are due to chance variation

$p < 0.05$ usually considered significant (Sometimes $p < 0.01$)

Means that $< 5\%$ chance that null hypothesis is true

Statistical tests

T-test (1 factor, 2 levels)

Correlation

ANOVA (1 factor, > 2 levels, multiple factors)

MANOVA (> 1 dependent variable)

Explaining Psychological Statistics
