

# Interaction II

*Maneesh Agrawala*  
*Jessica Hullman*

CS 294-10: Visualization  
Fall 2014

## Announcements

## Assignment 3: Visualization Software

Create a **small** interactive visualization application – you choose data domain and visualization technique.

1. Describe data and storyboard interface
2. Implement interface and produce final writeup
3. Submit the application and a final writeup on the wiki

Can work alone or in pairs

Final write up due before class on **Oct 15, 2014**

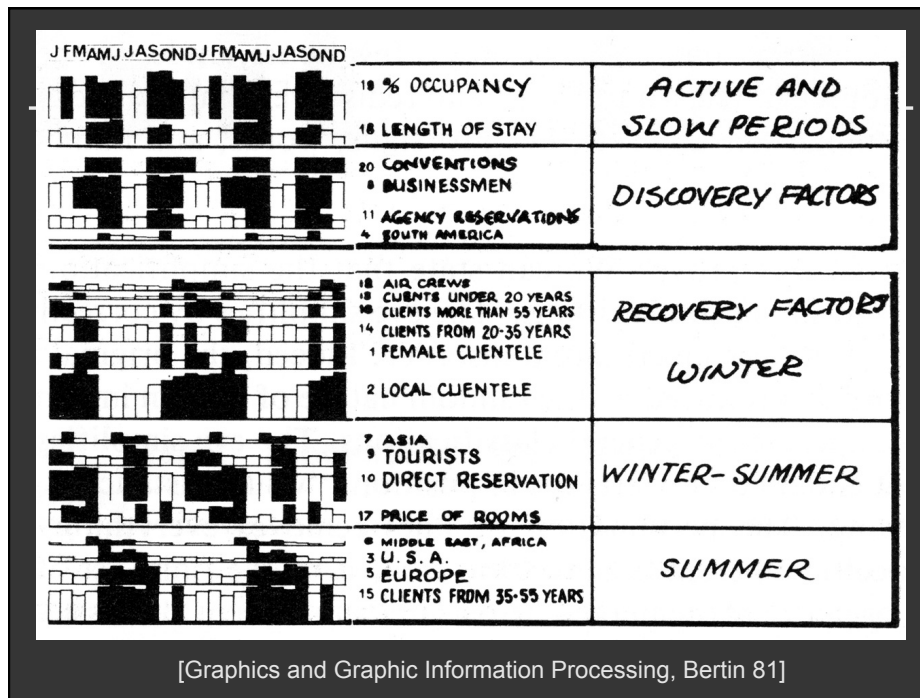

## Last Time: Interaction

J	F	M	A	M	J	J	A	S	O	N	D

[Graphics and Graphic Information Processing, Bertin 81]

[Graphics and Graphic Information Processing, Bertin 81]

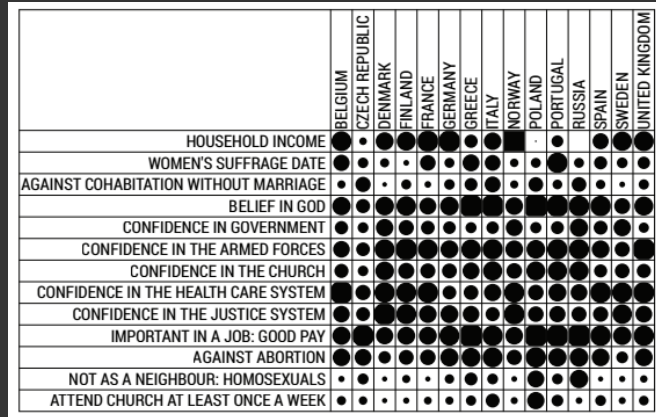

# Sorting

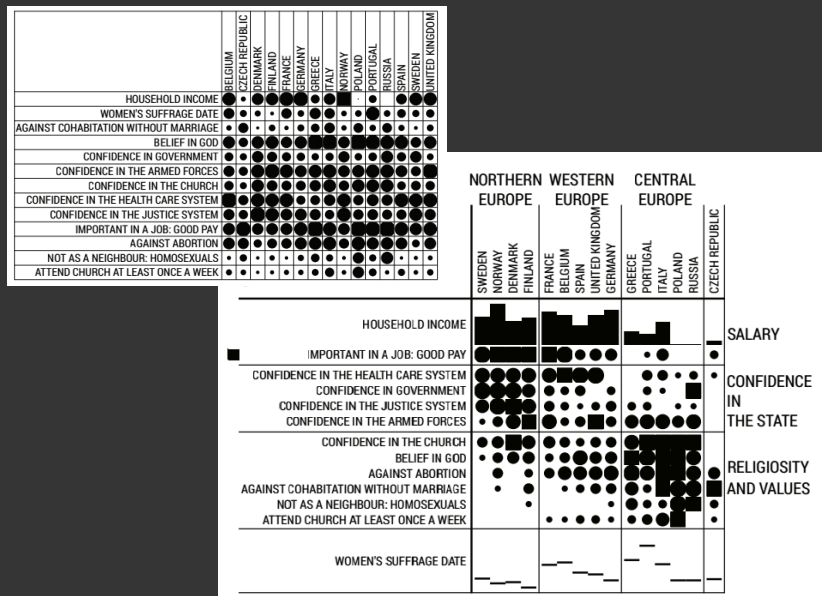

## Sorting by rows *and* columns

---

When might this be useful?

[Perin, Dragicevic, and Fekete 2014]

## Bertin Matrices

---

Research question

Table

1. Encode table cells visually
2. Group similar rows and columns to reveal patterns

## Group similar rows and columns

---

Choose a row with a particular visual aspect.  
Move to extremity of matrix.

Move similar rows close, opposite rows to bottom. (Creates two opposing groups and a middle group)

Repeat for columns

Iterate

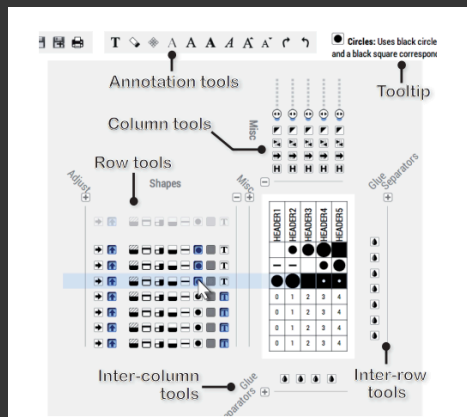

# Visual encodings

Quantity of ink is proportional to the normalized data value

# Reordering methods

## Manual

## Automatic

*bertifier.com*

# Trellis

[Becker, Cleveland, and Shyu 96]

Condition variables

location, year

Panel variables

type, yield

# Trellis

[Becker, Cleveland, and Shyu 96]

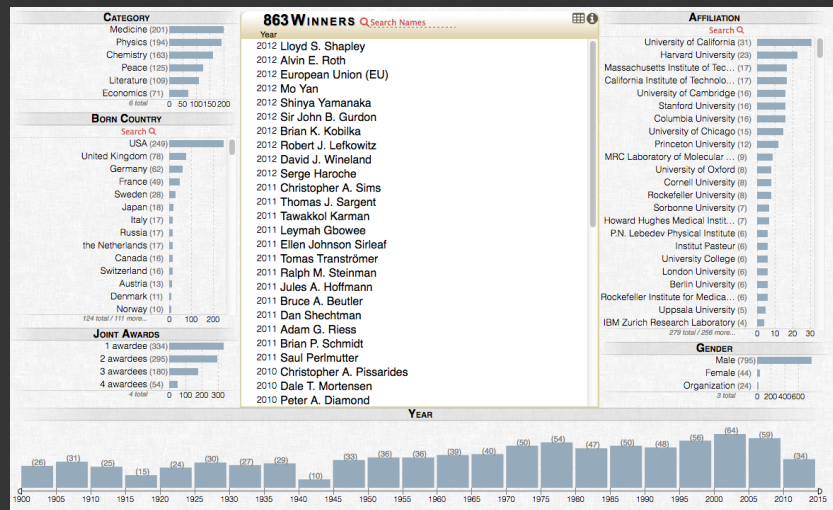

# Dynamic Queries

## NameVoyager

<http://www.babynamewizard.com/voyager>

# Keshif

<https://www.cs.umd.edu/hcil/keshif/>

## Direct manipulation

1. Visual representation of objects and actions
2. Rapid, incremental and reversible actions
3. Selection by pointing (not typing)
4. Immediate and continuous display of results

How quick does it need to be? (*rules of thumb*)

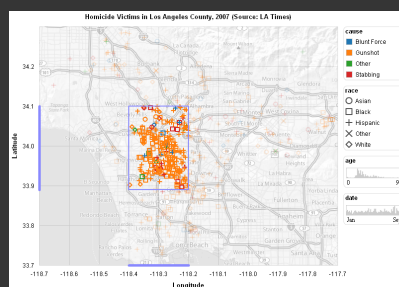

- 0.1s: Instantaneous
- 1.0s: Flow of thought uninterrupted
- 10s: Keeping user's attention on dialogue

[Miller 1968]

# Generalized Selection

## Visual Queries

### Model selections as declarative queries

$(-118.371 \leq \text{lon} \text{ AND } \text{lon} \leq -118.164) \text{ AND } (33.915 \leq \text{lat} \text{ AND } \text{lat} \leq 34.089)$

# Visual Queries

---

**Model selections as declarative queries**

**Applicable to dynamic, time-varying data**

**Retarget selection across visual encodings**

**Perform operations on query structure**

**“Select items like this one.”**

## Generalized Selection

---

Point to an example and define an abstraction  
based on one or more properties [Clark, Brennan]

*“Blue like this”*

*“The same shape as that”*

Abstraction may occur over multiple levels

This is not a sentence.

## Generalized Selection

Provide *generalization mechanisms* that enable users to *expand a selection query* along *chosen dimensions* of interest

Expand selections via *query relaxation*

# Query Builder

**Click: Select Items**

(id = 'China')

**Drag: Select Range**

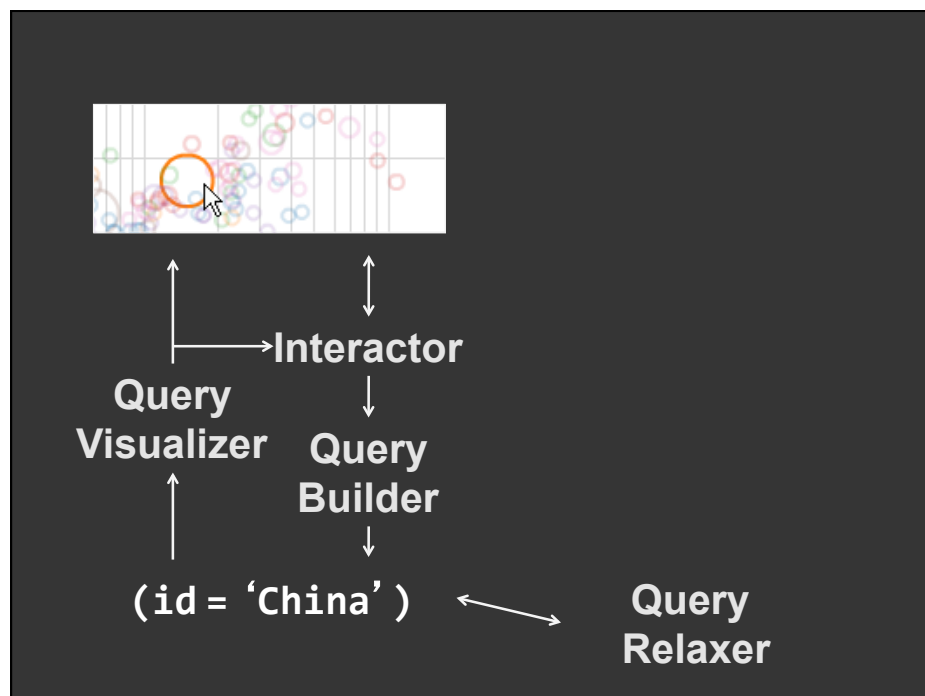

(2000 < gni AND gni < 10000) AND (.1 < internet AND internet < .2)

**Legend: Select Attributes**

(region = 'The Americas')

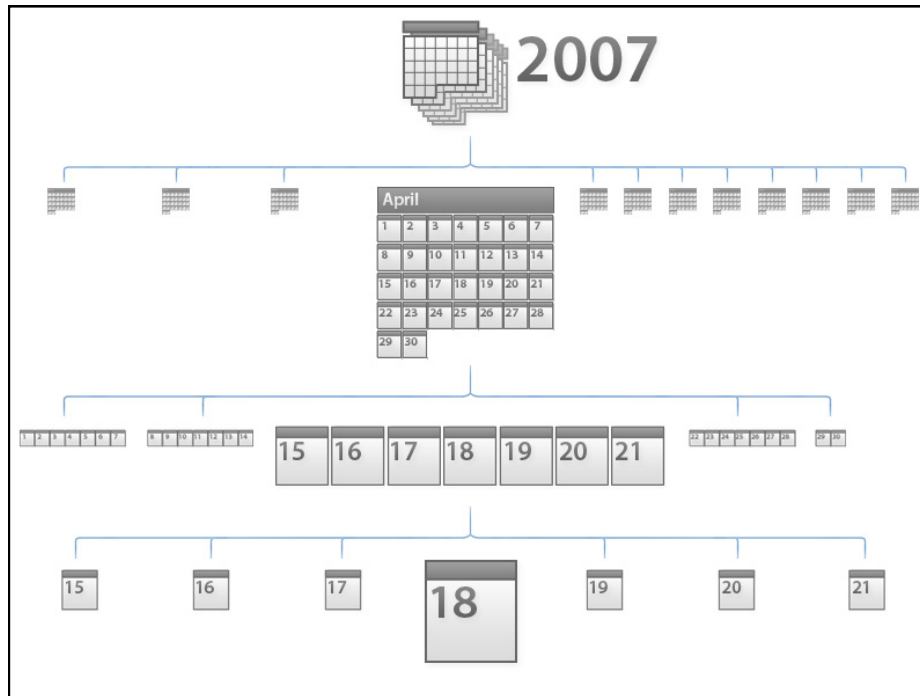

## Query Relaxation

Generalize an input query to create an expanded selection, according to:

1. A semantic structure describing the data
2. A traversal policy for that structure

## Relaxation using Hierarchies

Relax using abstraction hierarchies of the data  
 Traverse in direction of increasing generality

Examples

*A Priori*: Calendar, Categories, Geography

*Data-Driven*: Nearest-Neighbor, Clustering

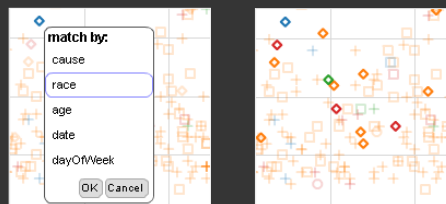

## Relaxation of Networks

## Relaxation using Attributes

If no explicit semantic structure is available,  
treat data itself as a “flat” hierarchy

Select all items with matching values along  
the attributes chosen for relaxation

## Lesson

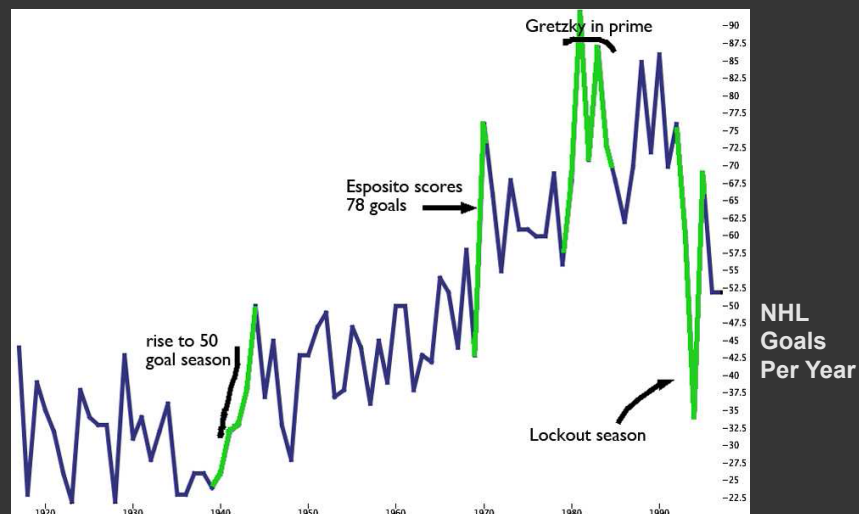

Consider how the structure and/or semantics of the data might be leveraged to aid analysis

Extension: look beyond data features to incorporate perceptual features of the display

Peaks,  
valleys,  
& slopes

## Perceptual Annotation [Kong & Agrawala 09]

## Other Input Modalities

### Multi-touch

---

- Tables, wall displays, tablets, whiteboards
- Does it facilitate visual analysis?
- What affordances are gained/lost?

# Kinetica

[Rzeszortarski and Kittur 2014]

## Framework

	<b>Forces</b>								
<b>Forces</b>	<i>Magnets</i> Points are pulled to a finger								
		<b>Layouts</b>							
<b>Layouts</b>	<i>Force plots</i> Points are pulled to their place in a chart	<i>Fixed charts</i> Points snap to their place on a chart							
			<b>Mutations</b>						
<b>Mutations</b>	<i>Group by vector</i> Group points that are moving similarly	<i>Group by layout</i> Group points by their place in a chart	<i>Groups</i> Put points into abstract groups						
				<b>Barriers</b>					
<b>Barriers</b>	<i>Jelly walls</i> Points need an extra push to pass a wall	<i>Layout walls</i> As points pass, put them into a layout	<i>Collision to data</i> Points that hit a wall are assigned values	<i>Walls</i> Block points from a region of space					
					<b>Filters</b>				
<b>Filters</b>	<i>Query magnet</i> Attract points that meet specific criteria	<i>Detail view</i> See point details in a layout popup	<i>Group by filter</i> Group points based on specific criteria	<i>Sieves</i> Walls only permit certain points	<i>Show/hide</i> Display points by criteria				
						<b>Queries &amp; Overlays</b>			
<b>Queries &amp; Overlays</b>	<i>Query fields</i> Visualize the pull of different forces	<i>Area details</i> See details for points that meet criteria	<i>Group zoom</i> Zoom in and manipulate points	<i>Lens</i> Highlight certain points in a region	<i>Selective overlay</i> Highlight/select points by criteria	<i>Overlays</i> Color/scale points by data dimensions			

**Forces** - Act on points to move, attract, or accelerate  
**Layouts** - Place points into meaningful locations  
**Mutations** - Mutate, combine, or change points  
**Barriers** - Prevent points from occupying a region  
**Filters** - Selectively include or exclude based on criteria  
**Queries** - Change the display appearance of points

## Grouping points

## Filtering points

## Filtering points

## Summary

### Most visualizations are interactive

- Even passive media elicit interactions

### Good visualizations are task dependant

- Choose the right space
- Pick the right interaction technique

### Human factors are important

- Leverage human strengths
- Assist to get past human limitations
